

SPRINT -3

Project Name:

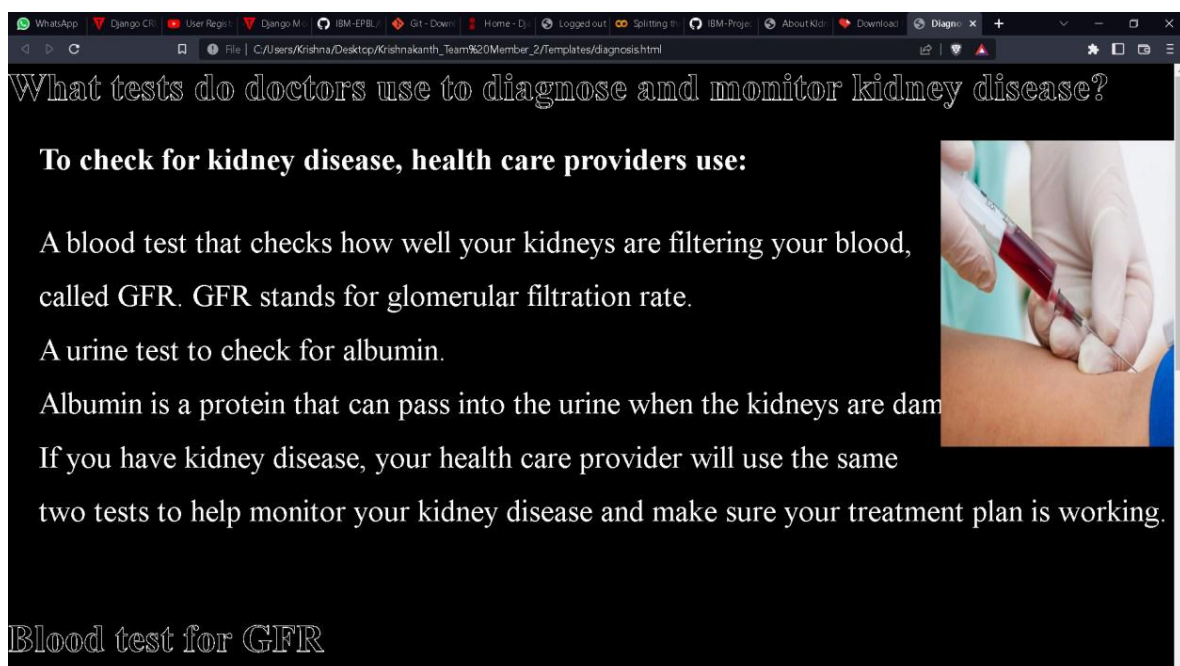

Early detection of chronic kidney disease using Machine Learning.

Team ID:

PNT2022TMID53897

DIAGNOSIS PAGE

This page contains diagnosis about CKD.

Blood test for GFR

Your health care provider will use a blood test to check your kidney function.

The results of the test mean the following:

A GFR of 60 or more is in the normal range.

Ask your health care provider when your GFR should be checked again.

A GFR of less than 60 may mean you have kidney disease.

Talk with your health care provider about how to keep your kidney health at this level.

A GFR of 15 or less is called kidney failure.
